ALI YASS KHUDHAIR

.NET Backend Engineer • Distributed Systems

yass39656@gmail.com +964 780 893 5782 Baghdad, Iraq github.com/aliyass2

SUMMARY

Backend engineer specializing in .NET 10 / ASP.NET Core with hands-on delivery across government-scale platforms: eVisa processing, biometric HR systems, and a multi-office document management platform deployed across 54 Iraqi passport offices. Experienced in microservices, modular monolith design, production observability, and audit-ready systems. Focused on building reliable, secure, and maintainable backend infrastructure suited to high-stakes financial and government environments.

SKILLS

LANGUAGES	C# (.NET 10 / 9 / 8) • Javascript
FRAMEWORKS	ASP.NET Core • Entity Framework Core • SignalR • Hangfire
ARCHITECTURE	DDD • Clean Architecture • Modular Monolith • Microservices • FSM Workflows
MESSAGING	RabbitMQ • Mass Transit • Outbox / Inbox Pattern • Idempotency
DATA	PostgreSQL • MongoDB • MySQL • pgvector • MinIO • Oracle
SECURITY	JWT / RBAC • Audit.NET • Rate Limiting • Multilingual Data Modeling
OBSERVABILITY	Open Telemetry (traces + metrics) • Prometheus • Grafana • Loki • Tempo • Seq
DEVOPS	Docker • Git • CI/CD • OTLP / gRPC • OTel Collector

EXPERIENCE

Software Developer — .NET Backend

2024 – Present

ScopeSky Communications — Baghdad, Iraq

- **Office Management Platform:** Designed and delivered a document workflow system deployed across 54 Iraqi passport offices; implemented RBAC, FSM-driven document processing, and multi-level approval chains.
- **Biometric HR System:** Built an event-driven microservices platform for ~2,000 employees with face-recognition attendance; used RabbitMQ/MassTransit with outbox/inbox pattern for reliable inter-service messaging, pgvector for embedding search, SignalR for real-time notifications, Hangfire for background jobs, and MinIO for document storage.
- **eVisa Platform:** Delivered an automated visa application workflow in .NET with Audit.NET event tracking, multilingual database design, and government-facing notification pipelines.
- **Ticket Management System:** Implemented an FSM-driven ticketing engine with 30+ state transitions, multi-level escalation logic, real-time updates, and a full audit trail — designed for compliance and traceability.
- **Production Observability Stack:** Stood up end-to-end observability: OpenTelemetry traces/metrics via OTLP/gRPC collector, Prometheus + Grafana dashboards, Loki log aggregation, Tempo distributed tracing with TraceQL, and Seq/Serilog structured logging. Debugged live rate-limiting incidents using Loki/LogQL correlation.
- **Modular Monolith Architecture:** Designed a schema-per-module modular monolith with clean module boundaries, enabling future service extraction without architectural rewrite.

ISP Technician — Network Support

2016 – 2024

Earthlink Telecommunications — Baghdad, Iraq

- Maintained and troubleshot ISP infrastructure (routers, switches, wireless) for enterprise clients across Baghdad.
- Diagnosed network incidents under time pressure, directly improving service reliability and SLA adherence.

SELECTED PROJECTS

- **Archive Management System:** .NET 10 + PostgreSQL + MinIO. DDD-based document archive with Hangfire automation for retention and compliance workflows.

- **HR Management System:** Event-driven microservices with RabbitMQ/MassTransit outbox pattern, Hangfire, SignalR, pgvector similarity search, MinIO storage, and Docker multi-VM deployment.
- **Ticket Management System:** FSM-driven workflow engine with 30+ transitions, multi-level approvals and escalations, real-time notifications, and audit-ready change history.
- **FaceId Attendance :** Biometric face-recognition attendance service; debugged and resolved HTTP 429 rate-limiting under load using Loki/LogQL log correlation and Grafana dashboards.

EDUCATION

B.Sc. Aeronautical Engineering — University of Baghdad 2019 – 2024

Baghdad, Iraq • Aerospace engineering background; pivoted into software development with a focus on distributed systems and backend architecture.
